Title: Description: Perfect Score: Sequence:

1 KACLNPASPMVQ 12

PAM 150 Gap 15 Scoring table:

122810 seqs, 40068593 residues Searched:

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

pir60 1:pirl 2:pir2 3:pir3 4:pir4

Mean 23.035; Variance 28.866; scale 0.798 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MAR-1999 (first entry) Human mature gro-gamma polypeptide used to treat sepsis. Gro-gamma; chemokine; human; sepsis; septic shock; therapy. Homo sapiens. Location/Qualifiers Frotein WO9848828-A1. 05-NOV-1998. 29-APR-1997; US-846966. (SMIK) SMITHILIB EBECHAM CORP. Demarsh PL, Johanson KO; WPI: 99-024031/02. Treating and preventing sepsis in animals - by using two modified gro b chemokines in conjunction with an anti-infective agent Example 1; Page 19; 26pp; English. Treating and preventing sepsis in animals - by using two modified gro b chemokines in conjunction with an anti-infective agent This is the amino acid sequence of the human gro-gamma chemokines and treating sepsis using chemokines selected from mature or modified murine KC (see W81499) or for-gamma (see W81499) or for-gamma (see W81499) or gro-beta (see W81499) or gro-gamma (see W81499) or gro-gamma comprises amino acids 5-73 of the mature polypeptide. Claimed method uses a dimer composed of 2 modified gro-beta (see W81499) or gro-gamma comprises amino acids 5-73 of the mature polypeptide. Claimed method uses a dimer composed of 2 modified gro-beta (see W81499) or gro-gamma (see W81499). The modified gro-gamma comprises amino acids 5-73 of the mature polypeptide. Claimed method uses a dimer composed of 2 modified gro-beta chemokines. Further claimed is administering the chemokines descrit in this invention are required to treat and prevent sepsis since antimicrobial agents alone have failed to abrogate septic mortalis sequence 73 AA;

                                                                                                                                                                                                                                          West of chemokines) such as KC and gro-alpha - to treat or prevent sepsis, particularly septic shock claim, 1; Page 19-20; 28pp. English.

A claimed method of treating or preventing sepsis comprises administering to an animal an effective amount of a chemokine selected from mature murine KC (see W18023), human gro alpha (see W18024), human gro beta (see W18025) and human gro plapa (see modified fragments of these chemokines and multimeric proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "Amino acids 18 to 32 of SEQ ID NO:1 in the specification from human interleukin-8"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note= "Amino acids 34 to 73 of SEQ ID NO:2 in the specification from GRO-gamma"
                                                                                                                                                                                                                                                                                                                                      comprising an association of two chemokine proteins. Sepsis can occur in hospitalised patients, and a consequence of bacterial sepsis septic shock. The method of the invention provides a treatment for sepsis, particularly septic shock, which is a major cause of death in intensive care units. Septic shock syndrome apparently has intractable resistance to the effects of a variety
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "Amino acids 1 to 18 of SEQ ID NO:2 in the specification from GRO-gamma"
                                                                                                                                                                                                                                                                                                                                                                                                          of highly potent antimicrobial agents. Survival is increased by treatment with the chemokines, both prophylactically and after

Interleukin-8 receptor 1 specific binding domain peptide(s) - used to modulate IL-8R1 mediated biological response

To modulate IL-8R1 mediated biological response

Example 3: Page 42: 51pp; English.

Example 3: Page 42: 51pp; English.

CC fris is the amino acid sequence of a protein (not designated in this specification but thought to be GRO(gamma), an agonist of the human interleukin (IL)-8 receptor type R2 (see W092/00326). The protein was used to generate GRO(gamma)/IL-8R1 binding domain chimaeras by replacing selected residues from the GRO(gamma) protein with corresp. residues from IL-8R binding peptide with residues from the specific comprising an IL-8R2 binding peptide with residues from the specific binding domain for the IL-8 receptor type R1. These domains are found in the amino-terminal loop and strand 3 of the 3 stranded anti-parallel continues in the amino-terminal loop and strand 3 of the 3 stranded anti-parallel continues IL-8 are important for binding to the IL-8 R1 receptor.

CC (reduce or enhance) IL-8 binding to the R1 receptor.

CC (reduce or enhance) IL-8 binding to the R1 receptor.

CC (reduce or enhance) IL-8 binding to the R1 receptor.

CC (reduce or enhance) IL-8 binding to the R1 receptor.

CC (reduce or enhance) IL-8 binding to the R1 receptor.

CC (reduce or enhance) IL-8 binding to the R1 receptor.

CC (reduce or enhance) IL-8 binding to the R1 receptor.

CC (reduce or enhance) IL-8 binding to the R1 receptor.

CC (reduce or enhance) IL-8 binding to the R1 receptor.

CC (reduce or enhance) IL-8 binding to the R1 receptor.

CC (reduce or enhance) IL-8 binding to the R1 receptor.

CC (reduce or enhance) IL-8 binding to the R1 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    31-JUL-1996 (first entry)
Protein used to generate IL-8/Gro(gamma) chimeric peptides.

                                                                                                                                                                                                                                                                 The present sequence represents a specifically claimed chimeric polypeptide (1813cG derived from human interleukin-8 (IL-8) and GRO-gamma. This polypeptide and similar examples of chimeric chemokines (146531 and 118646153G) also derived from human IL-8 and GRO-gamma, exhibit a chemokine protein structure capable of ILBR1 or ILBR2 binding. They can be used for modulating IL8 receptor-mediated biological responses. In particularly, they can be used for inhibiting IL8 receptor signal transduction.

N.B. The present sequence is not shown in the specification but is derived from SEQ ID NO:1 and 2, see features table.

A claimed method for reducing the no. of circulating platelets in the bloodstream of a mammal comprises admin. of MIP-1 and/or MIP-2 or their analogues to induce such a reduction. The MIP-1 indp-2 or analogue may be operatively linked to a carrier. The MIP-2 or used to inhibit megakaryocytopolesis to effect in vivo reduction of platelet nos. They can be used to treat disorders with excessively high platelet counts such as thrombocytosis, stroke, pulmonary emboliand myeloproliferative disorders.
                                                                            Macrophage inflammatory protein; megakaryocytopoiesis; MIP-1; MIP-2; thrombocythemia; reactive thrombocytosis; stroke; emboli; platelet; myeloproliferative disorder.

Treating myelosuppression or any condition involving treating myelosuppression or any condition involving treating myelosuppression or any condition involving treating myelosuppression or low levels of haematopoietic cells profit manusuppression or low levels of haematopoietic cells profit page 21; 31pp; English.

C. This polypeptide sequence comprises human gro gamma. Use of mammalian chemokines selected from gro alpha (W17670), gro beta c. (W17671), gro gamma or KC (W17669) for mobilising haematopoietic cells is claimed. The chemokines, optionally used together with a c. or low levels of haematopoietic regulator, are used to treat myelopoietic or any condition that involves immunosuppression or any condition that involves immunosuppression or low levels of haematopoietic cells, e.g. infection, cancer, myelopoietic of bone marrow cells. A claimed application of or autoimmune disease, or low production/differentiation of cor autoimmune disease, or low production/differentiation of cor autoimmune disease, or low production/differentiation of corputherapy. Chemokines having an N-terminal deletion are more certive, e.g. by 2 orders of magnitude, than the full-length protein. When used with a colony stimulating factor (CSF), a synergistic creduced. Compared with conventional methods of stem cell transplants, cueduced. Compared with conventional methods of stem cell transplants. Or peripheral blood mononnelear cells and/or nia*release of corputer of sections of stem cell transplants and colony stimulating and more rapid release of copy peripheral blood mononnelear cells and/or nia*release of copy and cells and/or nia*release of copy and cells and/or nia*release of copy and cells and/or nia*release of cells and/or nia*release of copy and cells and/or nia*release of cells and/or nia*release of cells cells and cells and/or nia*release of cells cells cells and cells cells and cells cells and cells cells and cells 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                drough and Gro gamma inflammatory cytokine(s) - for use in diagnosing colon cancer. Claim 25; Fig 1B; 46pp; English.

The cDNA clone coding for inflammatory cytokine Gro-gamma was stoolated from a mezerin- and calcium lonophore-stimulated leukocyte CDNA library. The amino acid sequence of Gro gamma was deduced from the nucleotide sequence. The level of Gro gamma in inflammatory response cells can be used as an indication of a test substance's inflammatory activity and to diagnose certain cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure: Fig 3; 68pp; English.

The sequence was deduced from the DNA obtd by screening the U937 CDNA library prepd. from poly-4+ RNA from PNA treated and LPS stimulated cells, using as probe a fragment isolated from the mMIP-2 cDNA (see 020728) encoding most of the mature mMIP-2 amino acid sequence. Two classes of human cDNA homologues to mMIP-2 were found designated alpha and beta. The alpha form (Q20729) is well aim W0920032; the beta form reproduced here is claimed in W09200326. The alpha form is the more abundant of the two. The genes can be used to produce recombinant MIP proteins for use in world healing, to modulate myelopoiesis and to induce adjuvant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human macrophage inflammatory protein 2-beta - for treating infections, cancer, myelopoietic dysfunction and auto:

From poly-A+ RNA from PMA treated and LPS stimulated cells, using as probe a fragment isolated from the mMIP-2 cDNA (see Q20612) encoding most of the mature mMIP-2 amino acid sequence. Two classes of human cDNA homolgous to mMIP-2 were found designated alpha and beta. The alpha form (Q20613) is claimed in W09200327; the beta more abundant of the two. The genes can be used to produce recombinant MIP proteins for use in wound healing, to modulate myelpoiseis and to induce adjuvant activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This is the amino acid sequence of the human chemokine gro-beta mature polypeptide. The invention relates to a method of preventing and treating sepsis using chemokines selected from mature or modified murine KC (see WB1497), or human gro-alpha (see mature), gro-beta or gro-gamma (see WB1499). A claimed method uses a dimeric chemokine consisting of 2 covalently linked modified gro-beta proteins (amino acids 5-73 of the mature polypeptide) in which the proteins are linked by 2 intermolecular disulphide bonds between C5-C31 and C7-C47. Further claimed is administering the chemokine in conjunction with an anti-infective agent. The
                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
             potentially useful for treating arthrifts, restenosis, cancer. Claim 12; Page 41-42; 60pp; English.

Claim 12; Page 41-42; 60pp; English.

Burlified heparamases, prepared under reducing conditions and activated with transglutaminase, are given in R70786-804. Most are prepared by reverse transcription of mRNA from activated human leukcytes, then cloning of the cDNA into pVL1392 baculovirus vector, and expression in Sf9 cells in the presence of reduced Sequence 107 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating and preventing sepsis in animals - by using two modified grob behankines in conjunction with an anti-infective agent Example 1; Page 18; 26pp; English.

This is the amino acid sequence of the human chemokine gro-beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     chemokines described in this invention are required to treat and prevent sepsis since antimicrobial agents alone have failed to shorogate septic mortality.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gro-alpha protein; chemokine; inflammation; antiinflammatory; hematopoietic synergistic factor; HSF; hematopoietic precursor; bone marrow; intercrine; desamino gro-beta; truncation.

Treating myelosuppression or any condition involving treating myelosuppression or low levels of haematopoietic cells immunosuppression or low levels of haematopoietic cells.

This polypeptide sequence comprises human gro beta. Use of mammalian chemokines selected from gro alpha (W17670, gro beta, gro damma (W17672) or KC (W17669) for mobilising haematopoietic cells is claimed. The chemokines, optionally used together with a growth factor or other haematopoietic regulator, are used to treat myelosuppression or any condition that involves immunosuppression or any condition, had involves immunosuppression or any condition, had involves immunosuppression or autoimmune disease, or low production/differentiation of remember or low production/differentiation of peripheral blood stem cell transplants in patients being treated by chemokines having an N-terninal deletion are more chemotherapy. Chemokines having an N-terninal deletion are more consumpated with a colony stimulating factor (CSF), a synergistic effect is achieved and the dose, and side-effects, of CSF can be consumpated with conventional methods of stem cell transplants, use of mammaolian chemokines provides a more rapid release of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
